

Thermal Arc Ultima 150

K+S can fully test and repair the Thermal Arc (Thermadyne) Ultima 150 Plasma Welding Power Supply.

Full dynamic testing is achieved by using the exact components required and recommended by Thermadyne, thereby ensuring a high quality repair. The Remote Current Control Device, Gas Tanks and Torch shown are some of the components required.

The welder has an integrated Indicator Lights Panel to aid the user in identifying the proper operation of the unit and if a problem is present the corresponding lights on the panel will indicate the problem area.

The unit can be found in many automated welding applications as well as all low current gas tungsten arc welding (GTAW) applications.
